System Architecture

Presentations are communication tools that can be used as demonstrations, lectures, speeches, reports, and more.

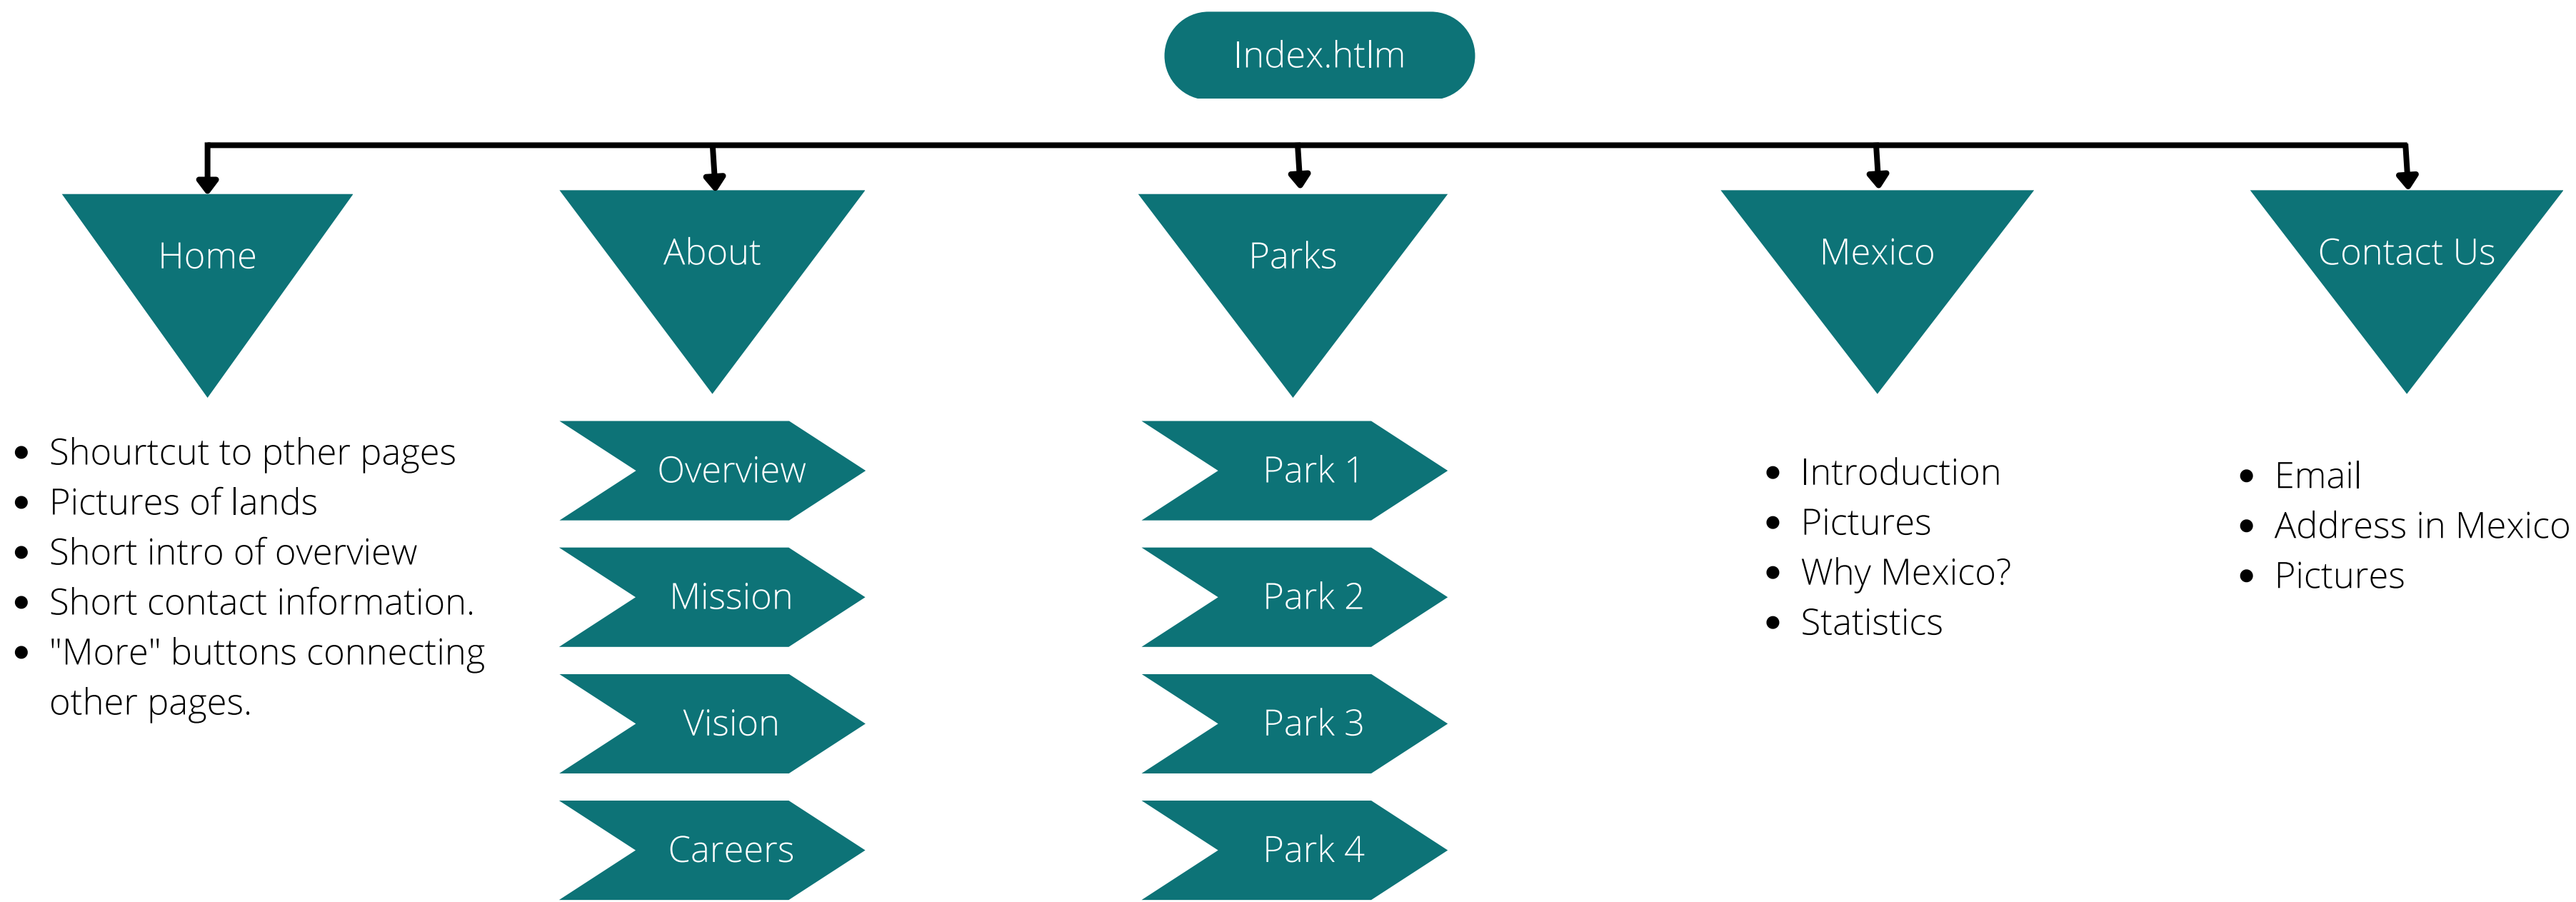

System Architecture

Web-based application architecture comprises 3 core components:

- 1) **Web Browser:** The browser or the client-side component or the front-end component is the key component that interacts with the user, receives the input and manages the presentation logic while controlling user interactions with the application. User inputs are validated as well, if required.
- 2) **Web Server:** The web server also known as the backend component or the server-side component handles the business logic and processes the user requests by routing the requests to the right component and managing the entire application operations. It can run and oversee requests from a wide variety of clients.
- 3) **Database Server:** The database server provides the required data for the application. It handles data-related tasks. In a multi-tiered architecture, database servers can manage business logic with the help of stored procedures.
